PROFESSIONAL SUMMARY

Senior Software Engineer with 8+ years of experience across payments infrastructure, open banking, embedded systems, and Web3. Currently at Mastercard building data enrichment and identity-matching services at scale. Deep expertise in Python, Java, Go, and Solana/Solidity with a track record of architecting greenfield systems, leading technical design, and mentoring growing engineering teams. MS Computer Science (Systems) from UC Santa Barbara.

EXPERIENCE

Senior Software Engineer — Mastercard | Jan 2022 – Present

Data Enrichment (DENR), Business Consumer Analytics (BCA) & Consent Platform teams • Salt Lake City, UT

- Led development of Identity-Matching service, reverse-engineering the Plaid Identity API to build Mastercard's own cross-platform identity resolution endpoint using Python, FastAPI, Pydantic, and MariaDB
- Designed and built scalable persistence-layer microservice for the Open Banking Consent Platform in Java (Spring Boot, Spring MVC, Spring Data) with Redis caching and PostgreSQL storage, deployed on Kubernetes
- Established team-wide local development standards using Docker, LocalStack, and docker-compose, reducing environment setup time and eliminating cross-environment bugs
- Transferred to DENR team to take on greater ownership of data enrichment design decisions, driving technical direction and expanding cross-team visibility
- Built oncall-agent during Innovation Time (dedicated weekly exploration hours): an automated incident-response tool that pulls context from Splunk, Dynatrace, xMatters, and GitLab to generate merge requests addressing production incidents

Software Engineer — Finicity (acquired by Mastercard) | May 2021 – Jan 2022

Salt Lake City, UT

- Built FinID microservice from scratch in Go, issuing and retrieving deduplicated financial identifiers for businesses and economic agents, backed by PostgreSQL
- Implemented scalable records storage and retrieval system in Java with SQL and Redis, deployed via Kubernetes through GitLab CI/CD pipelines

Software Engineer — Nexa3D | Aug 2019 – May 2021

Ventura, CA

- First full-time SWE hire; architected the entire multi-computer software platform and communication layer for a \$60K+ industrial 3D printer (NXE400), selecting SBCs, industrial computers, sensors, and actuators
- Built embedded server application (Python/Flask), sensor/actuator controller (C), and touchscreen UI (Qt/C++) for real-time printer operation and monitoring
- Grew engineering team from 1 to 5 direct contributors, peaking at ~20 SWEs after departure

Computer Engineer — Electro-Optical Industries | Sep 2017 – Aug 2019

Santa Barbara, CA

- Developed embedded firmware on bare-metal SoCs and RTOS platforms; owned company-wide source control infrastructure
- Designed and deployed building security system using SBC with integrated motion detectors and door sensors

Embedded Engineer — US Dept. of Energy – Special Technologies Laboratory | Jun 2015 – Aug 2017

Santa Barbara, CA (Contract)

- Led design and development of \$200K+ Sensor Test Fixture used for hardware verification, including embedded UI, peripheral interfaces, and sensor integration
- Built portable sensor device firmware with user-interface control, screen functionality, and peripheral drivers

PROJECTS

Founder & Lead Developer — BoxBazaar (boxbazaar.io) | 2024 – Present

- Building a decentralized collectibles exchange on Solana for sealed TCG products (Pokémon, Magic: The Gathering, One Piece) with a native SPL token
- Devnet live with test markets; built with Anchor and SPL tokens on Solana

Founder & Lead Developer — Open-Agora (open-agora.xyz) | 2024 – Present

- Decentralized AI agent marketplace on Solana enabling autonomous agent discovery, negotiation, and task execution with on-chain reputation scoring
- Protocol features escrow-based payments and bonded task agreements where funds are released to the performer upon verified completion, with on-chain reputation tracking for agent providers and consumers

MS Project — Decentralized Stock Ledger on Ethereum | 2018

- Built a decentralized stock trading ledger with on-chain order-book functionality on the Ethereum network as UC Santa Barbara Master’s capstone project

TECHNICAL SKILLS

Languages: Python, Java, Go, TypeScript/JavaScript, C, C++, Solidity, Rust, SQL, Perl, Verilog
Frameworks & Tools: FastAPI, Spring Boot, Flask, React, Qt, Docker, Kubernetes, GitLab CI/CD, LocalStack, Anchor (Solana)
Data & Infrastructure: PostgreSQL, MySQL/MariaDB, Redis, Amazon RDS, Splunk, SignalFx
Blockchain & Web3: Solana (Anchor, SPL, PDAs), Ethereum (Solidity), DeFi protocols, on-chain reputation systems
ML/Data Science: NumPy, SciPy, Scikit-Learn, TensorFlow, Keras, PyTorch

EDUCATION

M.S. Computer Science, Systems Specialization2015 – 2018

University of California, Santa Barbara • GPA: 3.86

B.S. Computer Engineering, High Honors2011 – 2015

University of California, Santa Barbara • GPA: 3.86

DISTINCTIONS

- Glen Culler Scholar, UCSB College of Engineering (2012–2014) • William R. Hearst Scholar (2015)
- UCSB Dean’s Honors (2011–2015) • Tau Beta Pi Engineering Honors Society
- **Published:** Automated Spot Defect Characterization in Field Portable NVG Test Set (SPIE, May 2018)
